Progress on Evaluation

- Have finished running a few models on the data set
  - Waiting for the scoring scripts to finish running
- Currently running the models on the dataset in batches to save time (running line by line is approximately 3x as long)

Roadblocks with GPU Utilization Metrics

- Currently we are running the models on the rows in batches
  - This doesn't allow for accurate tracking

- Following up on a point from last time about how to track the GPU usage:
  - We ended on the idea of taking multiple snapshots throughout the process for each row
  - A more accurate but more computationally intensive method would be to use multithreading
